

## SPECIFICATION

### Zinc Molybdate Powder

| Parameters       | Specification                                                      |
|------------------|--------------------------------------------------------------------|
| Appearance       | White powder                                                       |
| Molecular Weight | 225.33 g/mol                                                       |
| Boiling Point    | 1250 °C                                                            |
| Melting Point    | 1120 °C                                                            |
| Purity           | 99–99.5%                                                           |
| Solubility       | Insoluble in water, soluble in acids                               |
| Uses             | Pigment for paints and ceramics,<br>catalyst in chemical processes |
