

## SPECIFICATION

### Hexafluotitanic Acid 60%

| Parameters       | Specification                                                                  |
|------------------|--------------------------------------------------------------------------------|
| Appearance       | Colorless liquid                                                               |
| Molecular Weight | 163.87 g/mol                                                                   |
| Boiling Point    | 100 °C                                                                         |
| Melting Point    | -20 °C                                                                         |
| Purity           | 60–60%                                                                         |
| Refractive Index | 1.42                                                                           |
| Solubility       | Soluble in water                                                               |
| Uses             | Etchant for glass, reagent in fluorination, synthesis of fluorinated compounds |
